(Error)			
The COM8-15 outputs and SEG87-80 outputs share the pins and selecting a drive duty switches the pins to COM pins or SEG pins. For the pin configuration, refer to "Drive Duty Switching."			
Note: Be sure to avoid using the VC1 to VC5 pin outputs for driving external circuits.			
(Correct)			
The COM8-15 outputs and SEG87-80 outputs share the pins and selecting a drive duty switches the pins to COM pins or SEG pins. For the pin configuration, refer to "Drive Duty Switching."			
Note:			
<ul style="list-style-type: none"> ● Be sure to avoid using the VC1 to VC5 pin outputs for driving external circuits. ● <u>When LCD panel is connected, LCD16CTL.LCDDIS bit should be set to 1. If it has been set to 0, there is a possibility that LCD panel's characteristics is fluctuated.</u> 			

S1C17M30/M31/M32/M33/M34 Technical Manual, S7C17M11 Technical Manual

(Error)

The COM4–7 outputs and SEG0–4 outputs share the pins and selecting a drive duty switches the pins to COM pins or SEG pins. For the pin configuration, refer to “Drive Duty Switching.”

Note: Be sure to avoid using the VC1 to VC3 pin outputs of the model with an embedded LCD power supply for driving external circuits.

(Correct)

The COM4–7 outputs and SEG0–4 outputs share the pins and selecting a drive duty switches the pins to COM pins or SEG pins. For the pin configuration, refer to “Drive Duty Switching.”

Note:

- **Be sure to avoid using the VC1 to VC3 pin outputs of the model with an embedded LCD power supply for driving external circuits.**
- **When LCD panel is connected, LCD8CTL.LCDDIS bit should be set to 1. If it has been set to 0, there is a possibility that LCD panel’s characteristics is fluctuated.**

S1C17W13 Technical Manual

(Error)

If the port is shared with the LCD4A pin and other functions, the LCD4A output function must be assigned to the port before activating the LCD4A. For more information, refer to the “I/O Ports” chapter.

Note: Be sure to avoid using the VC1 to VC3 pin outputs for driving external circuits.

(Correct)

If the port is shared with the LCD4A pin and other functions, the LCD4A output function must be assigned to the port before activating the LCD4A. For more information, refer to the “I/O Ports” chapter.

Note:

- **Be sure to avoid using the VC1 to VC3 pin outputs for driving external circuits.**
- **When LCD panel is connected, LCD4CTL.LCDDIS bit should be set to 1. If it has been set to 0, there is a possibility that LCD panel’s characteristics is fluctuated.**

S1C17W14/W16 Technical Manual, S1C17W18 Technical Manual

(Error)

The COM4–7 outputs and SEG0–4 outputs share the pins and selecting a drive duty switches the pins to COM pins or SEG pins. For the pin configuration, refer to “Drive Duty Switching.”

Note: Be sure to avoid using the VC1 to VC3 pin outputs for driving external circuits

(Correct)

The COM4–7 outputs and SEG0–4 outputs share the pins and selecting a drive duty switches the pins to COM pins or SEG pins. For the pin configuration, refer to “Drive Duty Switching.”

Note:

- Be sure to avoid using the VC1 to VC3 pin outputs for driving external circuits
- When LCD panel is connected, LCD8CTL.LCDDIS bit should be set to 1. If it has been set to 0, there is a possibility that LCD panel’s characteristics is fluctuated.

S1C17W15 Technical Manual

(Error)

The COM4–7 outputs and SEG0–4 outputs share the pins and selecting a drive duty switches the pins to COM pins or SEG pins. For the pin configuration, refer to “Drive Duty Switching.”

Note: Be sure to avoid using the VC1 to VC4 pin outputs for driving external circuits.

(Correct)

The COM4–7 outputs and SEG0–4 outputs share the pins and selecting a drive duty switches the pins to COM pins or SEG pins. For the pin configuration, refer to “Drive Duty Switching.”

Note:

- Be sure to avoid using the VC1 to VC4 pin outputs for driving external circuits.
- When LCD panel is connected, LCD8CTL.MODEN bit should be set to 1. If it has been set to 0, there is a possibility that LCD panel’s characteristics is fluctuated.

S1C17W22/W23 Technical Manual

(Error)

If the port is shared with the LCD24A pin and other functions, the LCD24A output function must be assigned to the port before activating the LCD24A. For more information, refer to the “I/O Ports” chapter.

Note: Be sure to avoid using the VC1 to VC4 pin outputs for driving external circuits.

(Correct)

If the port is shared with the LCD24A pin and other functions, the LCD24A output function must be assigned to the port before activating the LCD24A. For more information, refer to the “I/O Ports” chapter.

Note:

- Be sure to avoid using the VC1 to VC4 pin outputs for driving external circuits.
- When LCD panel is connected, LCD24CTL.MODEN bit should be set to 1. If it has been set to 0, there is a possibility that LCD panel’s characteristics is fluctuated.

S1C17W34/W35/W36 Technical Manual

(Error)

The COM16–31 outputs and SEG0–15 or SEG79–64 outputs share the pins. Selecting a drive duty and COM[31:16] pin location switches the pins to COM pins or SEG pins. For the pin configuration, refer to “Drive Duty Switching.”

Note: Be sure to avoid using the VC1 to VC5 pin outputs for driving external circuits.

(Correct)

The COM16–31 outputs and SEG0–15 or SEG79–64 outputs share the pins. Selecting a drive duty and COM[31:16] pin location switches the pins to COM pins or SEG pins. For the pin configuration, refer to “Drive Duty Switching.”

Note:

- Be sure to avoid using the VC1 to VC5 pin outputs for driving external circuits.
- When LCD panel is connected, LCD32CTLMODEN bit should be set to 1. If it has been set to 0, there is a possibility that LCD panel's characteristics is fluctuated.

Figure 14.4.3.2 Master Mode Data Reception Flowchart

14.4.6 Data Reception in Slave Mode

A data receiving procedure in slave mode and the I2C Ch.n operations are shown below. Figures 14.4.6.1 and 14.4.6.2 show an operation example and a flowchart, respectively.

Data receiving procedure

1. Wait for a START condition interrupt (I2CnINTF.STARTIF bit=1).
2. Check to see if the I2CnINTF.TR bit=0 (reception mode).
(Start a data sending procedure if I2CnINTF.TR bit=1.)
3. Clear the I2CnINTF.STARTIF bit by writing 1.
4. Wait for a receive buffer full interrupt (I2CnINTF.RBFIF bit=1) generated when a one-byte reception has completed or an end of transfer interrupt (I2CnINTF.BYTEENDIF bit=1).
Clear the I2CnINTF.BYTEENDIF bit by writing 1 after the interrupt has occurred.
5. If the next receive data is the last one, write 1 to the I2CnCTL.TXNACK bit to send a NACK after it is received.

6. Read the received data from the I2CnRXD register.
7. Repeat Steps 4 to 6 until the end of data reception.
8. Wait for a STOP condition interrupt (I2CnINTF.STOPIF bit=1) or a START condition interrupt (I2CnINTF.STARTIF bit=1).
 - i. Go to Step 9 when a STOP condition interrupt has occurred.
 - ii. Go to Step 2 when a START condition interrupt has occurred.
9. Clear the I2CnINTF.STOPIF bit and then terminate data receiving operations.

14.4.3 Data Reception in Master Mode

A data receiving procedure in master mode and the I2C Ch.n operations are shown below. Figures 14.4.3.1 and 14.4.3.2 show an operation example and a flowchart, respectively.

Data receiving procedure

1. When a one-byte reception, write 1 to the I2CnCTL.TXNACK bit.
2. Issue a START condition by setting the I2CnCTL.TXSTART bit to 1.
3. Wait for a transmit buffer empty interrupt (I2CnINTF.TBEIF bit=1) or a START condition interrupt (I2CnINTF.STARTIF bit=1).
Clear the I2CnINTF.STARTIF bit by writing 1 after the interrupt has occurred.
4. Write the 7-bit slave address to the I2CnTXD.TXD[7:1] bits and 1 that represents READ as the data transfer direction to the I2CnTXD.TXD0 bit.
5. Wait for a receive buffer full interrupt (I2CnINTF.RBFIF bit=1) generated when a one-byte reception has completed or a NACK reception interrupt (I2CnINTF.NACKIF bit=1) generated when a NACK is received.

- i. Go to Step 6 when a receive buffer full interrupt has occurred.
- ii. Clear the I2CnINTF.NACKIF bit and issue a STOP condition by setting the I2CnCTL.TXSTOP bit to 1 when a NACK reception interrupt has occurred. Then go to Step 9 or Step 2 if making a retry.
- 6. Perform one of the operations below when the last or next-to-last data is received.
 - i. When the next-to-last data is received, write 1 to the I2CnCTL.TXNACK bit to send a NACK after the last data is received, and then go to Step 7.
 - ii. When the last data is received, read the received data from the I2CnRXD register and set the I2CnCTL.TXSTOP to 1 to generate a STOP condition. Then go to Step 9.
- 7. Read the received data from the I2CnRXD register.
- 8. Repeat Steps 5 to 7 until the end of data reception.
- 9. Wait for a STOP condition interrupt (I2CnINTF.STOPIF=1).
Clear the I2CnINTF.STOPIF bit by writing 1 after the interrupt has occurred.

Data receiving operations

Figure 14.4.3.2 Master Mode Data Reception Flowchart

14.4.6 Data Reception in Slave Mode

A data receiving procedure in slave mode and the I2C Ch.n operations are shown below. Figures 14.4.6.1 and 14.4.6.2 show an operation example and a flowchart, respectively.

Data receiving procedure

1. When a one-byte reception, write 1 to the I2CnCTL.TXNACK bit.
2. Wait for a START condition interrupt (I2CnINTF.STARTIF bit=1).
3. Check to see if the I2CnINTF.TR bit=0 (reception mode).
(Start a data sending procedure if I2CnINTF.TR bit=1.)
4. Clear the I2CnINTF.STARTIF bit by writing 1.
5. Wait for a receive buffer full interrupt (I2CnINTF.RBFIF bit=1) generated when a one-byte reception has completed or an end of transfer interrupt (I2CnINTF.BYTEENDIF bit=1).
Clear the I2CnINTF.BYTEENDIF bit by writing 1 after the interrupt has occurred.
6. If the next receive data is the last one, write 1 to the I2CnCTL.TXNACK bit to send a NACK after it is received.
7. Read the received data from the I2CnRXD register.
8. Repeat Steps 5 to 7 until the end of data reception.
9. Wait for a STOP condition interrupt (I2CnINTF.STOPIF bit=1) or a START condition interrupt (I2CnINTF.STARTIF bit=1).
 - i. Go to Step 10 when a STOP condition interrupt has occurred.
 - ii. Go to Step 3 when a START condition interrupt has occurred.
10. Clear the I2CnINTF.STOPIF bit and then terminate data receiving operations.
