Pop-free 120 mW stereo headphone amplifier

Datasheet - production data

TS488IST - MiniSO-8

TS488IQT - DFN8

Features

- Pop and click noise protection circuitry
- Operating range from V_{CC} = 2.2 V to 5.5 V
- Standby mode active low (TS488) or high (TS489)
- Output power:
  - 120 mW at 5 V, into 16 Ω with 0.1% THD+N max (1 kHz)
  - 55 mW at 3.3 V, into 16 Ω with 0.1% THD+N max (1 kHz)
- Low current consumption: 2.7 mA max at 5 V
- Ultra-low standby current consumption: 10 nA typical
- High signal-to-noise ratio
- High crosstalk immunity: 102 dB (F = 1 kHz)
- PSRR: 70 dB typ. (F = 1 kHz), inputs grounded at 5 V
- Unity-gain stable
- Short-circuit protection circuitry
- Available in lead-free MiniSO-8 & DFN8 (2 x 2 mm)

Description

The TS488/9 is an enhancement of TS486/7 that eliminates pop and click noise and reduces the number of external passive components.

The TS488/9 is a dual audio power amplifier capable of driving, in single-ended mode, either a 16 Ω or a 32 Ω stereo headset.

Capable of descending to low voltages, it delivers up to 31 mW per channel (into 16 Ω loads) of continuous average power with 0.1% THD+N in the audio bandwidth from a 2.5 V power supply.

An externally-controlled standby mode reduces the supply current to 10 nA (typ.). The unity gain stable TS488/9 is configured by external gain-setting resistors.

Applications

- Headphone amplifiers
- Mobile phones, PDAs, computer motherboards
- High-end TVs, portable audio players

This is information on a product in full production.

Contents

1   Typical application schematic

Figure 1. Typical application for the TS488-TS489
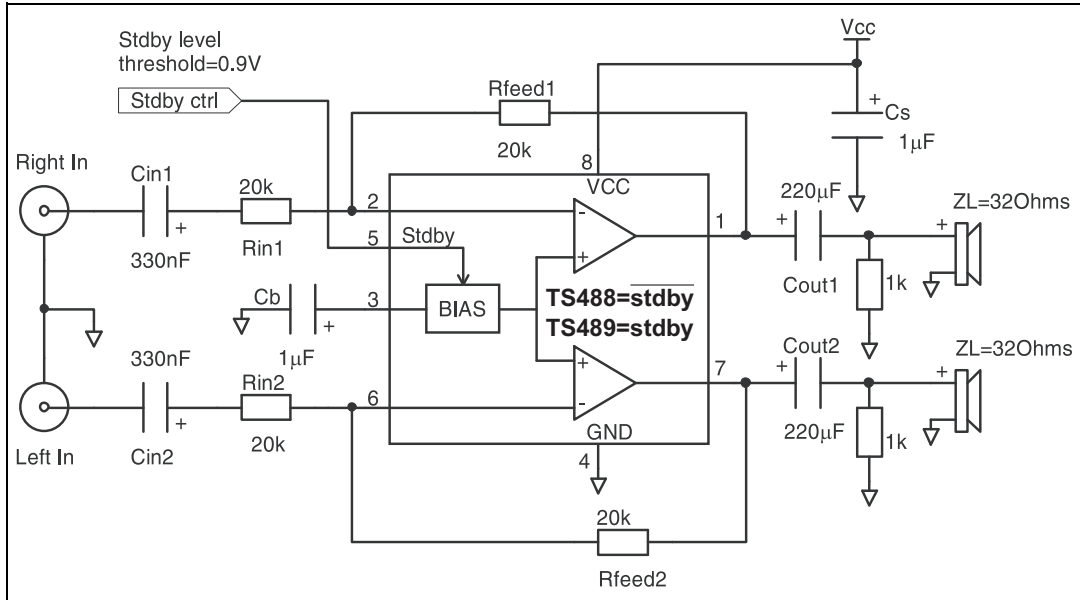

Table 1. Application component information

Component	Functional description
$R_{in1,2}$	Inverting input resistor that sets the closed loop gain in conjunction with R_{feed}. This resistor also forms a high pass filter with C_{in} ($F_c = 1 / (2 \times Pi \times R_{in} \times C_{in})$).
$C_{in1,2}$	Input coupling capacitor that blocks the DC voltage at the amplifier's input terminal.
$R_{feed1,2}$	Feedback resistor that sets the closed loop gain in conjunction with R_{in}. A_V= Closed Loop Gain= $-R_{feed}/R_{in}$.
C_s	Supply output capacitor that provides power supply filtering.
C_b	Bypass capacitor that provides half supply filtering.
$C_{out1,2}$	Output coupling capacitor that blocks the DC voltage at the load input terminal. This capacitor also forms a high pass with R_L ($F_c = 1 / (2 \times Pi \times R_L \times C_{out})$).

2 Absolute maximum ratings and operating conditions

Table 2. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage[1]	6	V
V_i	Input voltage	-0.3 V to V_{CC} +0.3 V	V
T_{stg}	Storage temperature	-65 to +150	°C
T_j	Maximum junction temperature	150	°C
R_{thja}	Thermal resistance junction-to-ambient MiniSO-8 DFN8	215 70	°C/W
P_{diss}	Power dissipation[2]: MiniSO-8 DFN8	0.58 1.79	W
ESD	Human body model (pin-to-pin)	2	kV
ESD	Machine model 220 pF - 240 pF (pin-to-pin)	200	V
Latch-up	Latch-up immunity (all pins)	200	mA
	Lead temperature (soldering, 10 sec)	250	°C
	Output short-circuit to V_{CC} or GND	continuous [3]	

1. All voltage values are measured with respect to the ground pin.

2. P_{diss} is calculated with T_{amb} = 25 °C, T_j = 150 °C.

3. Attention must be paid to continuous power dissipation (V_{DD} x 250 mA). Short-circuits can cause excessive heating and destructive dissipation. Exposing the IC to a short-circuit for an extended period of time will dramatically reduce the product's life expectancy.

Table 3. Operating conditions

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage	2.2 to 5.5	V
R_L	Load resistor	≥ 16	Ω
T_{oper}	Operating free air temperature range	-40 to + 85	°C
C_L	Load capacitor: R_L = 16 to 100 Ω R_L > 100 Ω	400 100	pF
V_{STBY}	Standby voltage input: TS488 active, TS489 in standby TS488 in standby, TS489 active	$1.5 \leq V \leq V_{CC}$ $GND \leq V_{STBY} \leq 0.4$ [1]	V
R_{thja}	Thermal resistance junction-to-ambient MiniSO-8 DFN8[2]	190 40	°C/W

1. The minimum current consumption (I_{STBY}) is guaranteed at GND (TS488) or V_{CC} (TS489) for the whole temperature range.

2. When mounted on a 4-layer PCB.

3 Electrical characteristics

Table 4. Electrical characteristics at V_{CC} = +5 V
with GND = 0 V, T_{amb} = 25 °C (unless otherwise specified)

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
I_{CC}	Supply current	No input signal, no load		2	2.7	mA
I_{STBY}	Standby current	No input signal, V_{STBY} = GND for TS488, R_L = 32 Ω		10	1000	nA
		No input signal, V_{STBY} = V_{CC} for TS489, R_L = 32 Ω		10	1000	
P_{out}	Output power	THD+N = 0.1% max, F = 1 kHz, R_L = 32 Ω		75		mW

4 Application information

4.1 Power dissipation and efficiency

Hypotheses:

- Voltage and current in the load are sinusoidal (V_{out} and I_{out}).
- Supply voltage is a pure DC source (V_{CC}).

Regarding the load we have:

$$V_{OUT} = V_{PEAK}\sin\omega t(V)$$

and

$$I_{OUT} = \frac{V_{OUT}}{R_L}(A)$$

and

$$P_{OUT} = \frac{V_{PEAK}^2}{2R_L}(A)$$

The average current delivered by the power supply voltage is:

$$I_{CC_{AVG}} = \frac{1}{2\pi}\int_0^\pi \frac{V_{PEAK}}{R_L}\sin(t)dt = \frac{V_{PEAK}}{\pi R_L}(A)$$

Figure 78. Current delivered by power supply voltage in single-ended configuration
The power delivered by power supply voltage is:

$$P_{supply} = V_{CC}I_{CC_{AVG}}(W)$$

So, the power dissipation by each power amplifier is

$$P_{diss} = P_{supply} - P_{OUT}(W)$$

$$P_{diss} = \frac{\sqrt{2}V_{CC}}{\pi\sqrt{R_L}}\sqrt{P_{OUT}} - P_{OUT}(W)$$

and the maximum value is obtained when:

$$\frac{\partial P_{diss}}{\partial P_{OUT}} = 0$$

and its value is:

$$P_{diss_{MAX}} = \frac{V_{CC}^2}{\pi^2 R_L}(W)$$

Note: *This maximum value depends only on power supply voltage and load values.*

The **efficiency** is the ratio between the output power and the power supply:

$$\eta = \frac{P_{OUT}}{P_{supply}} = \frac{\pi V_{peak}}{2V_{CC}}$$

The **maximum theoretical value** is reached when $V_{peak} = V_{CC}/2$, so

$$\eta = \frac{\pi}{4} = 78.5\%$$

4.2   Total power dissipation

The TS488/9 is stereo (dual channel) amplifier. It has two independent power amplifiers. Each amplifier produces heat due to its power dissipation. Therefore the maximum die temperature is the sum of each amplifier's maximum power dissipation. It is calculated as follows:

- $P_{diss\,R}$ = Power dissipation due to the right channel power amplifier.
- $P_{diss\,L}$ = Power dissipation due to the left channel power amplifier.
- Total P_{diss} = $P_{diss\,R}$ + $P_{diss\,L}$ (W)

Typically, $P_{diss\,R}$ is equal to $P_{diss\,L}$, giving:

$$TotalP_{diss} = 2P_{dissR} = 2P_{dissL}$$

$$TotalP_{diss} = \frac{2\sqrt{2}V_{CC}}{\pi\sqrt{R_L}}\sqrt{P_{OUT}} - 2P_{OUT}$$

4.3   Lower cutoff frequency

The lower cutoff frequency F_{CL} of the amplifier depends on input capacitors C_{in} and output capacitors C_{out}.

The input capacitor C_{in} (output capacitor C_{out}) in serial with the input resistor R_{in} (load resistor R_L) of the amplifier is equivalent to a first order high pass filter. Assuming that F_{CL} is the lowest frequency to be amplified (with a 3 dB attenuation), the minimum value of the C_{in} (C_{out}) is:

$$C_{in} = \frac{1}{2\pi \cdot F_{CL} \cdot R_{in}}$$

$$C_{out} = \frac{1}{2\pi \cdot F_{CL} \cdot R_L}$$

Figure 79. Lower cutoff frequency vs. input capacitor
Figure 80. Lower cutoff frequency vs. output capacitor
Note: *In case F_{CL} is kept the same for calculation, It must be taken in account that the 1st order high-pass filter on the input and the 1st order high-pass filter on the output create a 2nd order high-pass filter in the audio signal path with an attenuation 6 dB on F_{CL} and a roll-off 40db/decade.*

4.4 Higher cutoff frequency

In the high-frequency region, you can limit the bandwidth by adding a capacitor C_{feed} in parallel with R_{feed}. It forms a low-pass filter with a -3 dB cutoff frequency F_{CH}. Assuming that F_{CH} is highest frequency to be amplified (with a 3 dB attenuation), the maximum value of C_{feed} is:

$$F_{CH} = \frac{1}{2\pi \cdot R_{feed} \cdot C_{feed}}$$

Figure 81. Higher cutoff frequency vs. feedback capacitor
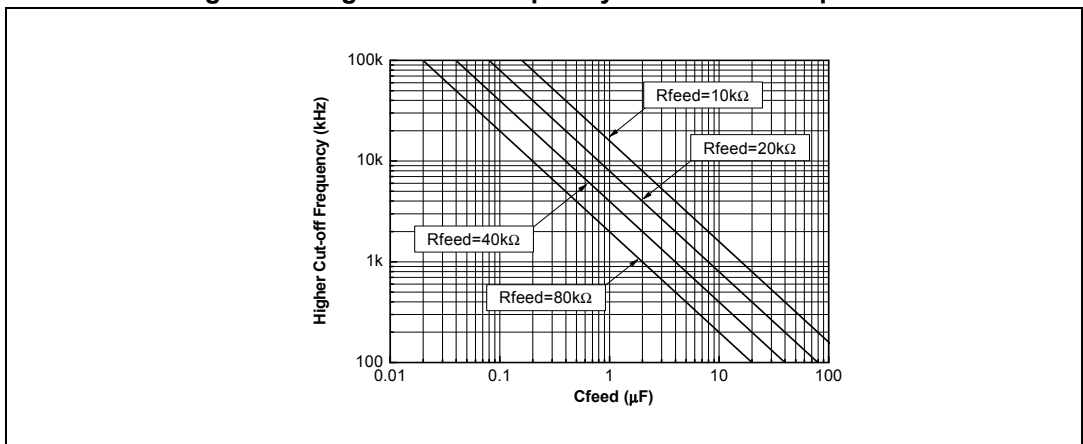

4.5 Gain setting

In the flat frequency response region (with no effect from C_{in}, C_{out}, C_{feed}), the output voltage is:

$$V_{OUT} = V_{IN} \cdot \left(-\frac{R_{feed}}{R_{in}}\right) = V_{IN} \cdot A_V$$

The gain A_V is:

$$A_V = -\frac{R_{feed}}{R_{in}}$$

4.6 Decoupling of the circuit

Two capacitors are needed to properly bypass the TS488 (TS489), a power supply capacitor C_s and a bias voltage bypass capacitor C_b.

C_s has a strong influence on the THD+N in the high frequency range (above 7kHz) and indirectly on the power supply disturbances. With 1 µF, you can expect THD+N performance to be similar to the one shown in the datasheet. If C_s is lower than 1 µF, the THD+N increases in the higher frequencies and disturbances on the power supply rail are less filtered. On the contrary, if C_s is higher than 1 µF, the disturbances on the power supply rail are more filtered.

C_b has an influence on the THD+N in the low frequency range. Its value is critical on the PSRR with grounded inputs in the lower frequencies:

* If C_b is lower than 1 µF, the THD+N improves and the PSRR worsens.
* If C_b is higher than 1 µF, the benefit on the THD+N and PSRR is small.

Note: *The input capacitor C_{in} also has a significant effect on the PSRR at lower frequencies. The lower the value of C_{in}, the higher the PSRR.*

4.7 Standby mode

When the standby mode is activated an internal circuit of the TS488 (TS489) is charged (see *Figure 82*). A time required to change the internal circuit is a few microseconds.

Figure 82. Internal equivalent schematic of the TS488 (TS489) in standby mode
4.8 Wake-up time

When the standby is released to put the device ON, the bypass capacitor C_b is charged immediately. As C_b is directly linked to the bias of the amplifier, the bias will not work properly until the C_b voltage is correct. The time to reach this voltage plus a time delay of 20 ms (pop precaution) is called the wake-up time or t_{WU}; it is specified in the electrical characteristics table with C_b = 1μF.

If C_b has a value other than 1μF, t_{WU} can be calculated by applying the following formulas or can be read directly from *Figure 83*.

$$t_{WU} = \frac{C_b \cdot 2.5}{0.03125} + 20 \quad [ms; \mu F]$$

Figure 83. Typical wake-up time vs. bypass capacitance

Note: *It is assumed that the C_b voltage is equal to 0V. If the C_b voltage is not equal to 0V, the wake-up time is shorter.*
4.9 POP performance

Pop performance is closely related to the size of the input capacitor C_{in}. The size of C_{in} is dependent on the lower cutoff frequency and PSRR values requested.

In order to reach low pop, C_{in} must be charged to V_{CC}/2 in less than 20 ms. To follow this rule, the equivalent input constant time ($R_{in}C_{in}$) should be less then 6.7 ms:

$\tau_{in} = R_{in} \times C_{in} < 0.0067$ (s)

Example calculation:

In the typical application schematic R_{in} is 20 kΩ and C_{in} is 330 nF. The lower cutoff frequency (-3 db attenuation) is given by the following formula:

$$F_{CL} = \frac{1}{2\pi \cdot R_{in} \cdot C_{in}}$$

With the values above, the result is F_{CL} = 25 Hz.

In this case, $\tau_{in} = R_{in} \times C_{in}$=6.6 ms.

This value is sufficient with regard to the previous formula, thus we can state that the pop is imperceptible.

4.10   Connecting the headphones

Generally headphones are connected using jack connectors. To prevent a pop in the headphones when plugging in the jack, a pulldown resistor should be connected in parallel with each headphone output. This allows the capacitors C_{out} to be charged even when the headphones are not plugged in.

Pulldown resistors with a value of 1 kΩ are high enough to be a negligible load, and low enough to charge the capacitors C_{out} in less than one second.

Note: *The pop&click reduction circuitry works properly only when both channels have the same value for the external components C_{in}, C_{out}, R_{load} and $R_{pulldown}$.*
5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: *www.st.com*. ECOPACK® is an ST trademark.

5.1 MiniSO-8 package information

7 Revision history

Table 10. Document revision history

Date	Revision	Changes
2-Jan-2006	1	First release corresponding to the product preview version.
1-Feb-2006	2	Removal of typical application schematic on first page (it appears in Figure 1 on page 3). Minor grammatical and formatting corrections throughout.
4-Aug-2006	3	Update of marking. Update of DFN8 package height. Editorial update.
15-Sep-2006	4	Revision corresponding to the release to production of the TS488 - TS489.
14-May-2012	5	Removed obsolete part numbers TS489IQT and TS489IST from the cover page and Table 8: Order codes. Updated ECOPACK® text in Section 5: Package mechanical data. Updated package in Section 5.2: DFN8 package.
13-Apr-2017	6	Updated *Section 5.2: DFN8 package information*: "L" dimension changed from 0.5 mm to 0.425 mm. Minor changes throughout the document.

IMPORTANT NOTICE – PLEASE READ CAREFULLY
